Thiruvananthapuram, March 21, 2018: Indian Space Research Organisation (ISRO) on Wednesday launched a book into space aboard a Polar Satellite Launch Vehicle (PSLV) C-36 from .Conformational preferences for the Phe-Phe turn: are they in accordance with force field approximations? The Phe-Phe turn has been popular since its discovery. It was included in the list of protein motifs for submission to PDB as early as 1997, and its popularity as a beta-turn type is still increasing. However, despite its success, several studies have suggested a problem with the Phe-Phe turn, particularly in regard to its stability. In this work, the Phe-Phe turn, in both its L and JK conformations, is rigorously optimized using a fast ab initio method, and the stability is assessed through the vibrational analysis. The key is that the force fields used are relatively accurate (AMBER, CHARMM and OPLS) to determine whether the apparently low-energy stable structures found by ab initio methods are really stable. Subsequently, the Phe-Phe turn is also evaluated using several popular empirical force fields to investigate if the structural preferences of the Phe-Phe turn are in accordance with the existing force fields. The results suggest that the problem is not due to an inaccurate force field, but rather to the energy evaluations. Therefore, for

a well-structured polypeptide, the most stable conformation, obtained with no restraints, is the correct one.

1. Field of the Invention The present invention generally relates to a device for preventing a vehicle steering wheel from coming off of the steering shaft in the direction of the axis thereof. More specifically, this invention pertains to a device for preventing a vehicle steering wheel from coming off of a steering shaft in the direction of the axis thereof by utilizing a creeper to engage the steering shaft.

2. Description of the Related Art A creeper, which acts as a support tool for vehicle assembly, has been used for supporting a steering shaft. The creeper has an engaging means such as a spiral or tape. In an assembly line, the creeper is arranged along the steering shaft and the creeper is moved to the predetermined support position where the steering shaft is stopped and the engaged means is pushed to the outside of a groove of the steering shaft at the support position. When the creeper
